1 Description

The Heston Vasicek model concerns with cases where the volatility V and the interest rate r are assumed to be stochastic. The dynamics under the risk neutral measure of the share price S and the volatility process V are governed by the stochastic differential equation system

$$\begin{aligned}
\frac{dS_t}{S_t} &= (r_t - \eta)dt + \sqrt{V_t}\, dZ_t, \\
dV_t &= \kappa_V(\theta_V - V_t)dt + \sigma_V\sqrt{V_t}\, dW_t^1, \\
dr_t &= \kappa_r(\theta_r - r_t)dt + \sigma_r dW_t^2,
\end{aligned}$$

with initial data $S_0 > 0$, $V_0 > 0$ and $r_0 > 0$, where Z, W^1 and W^2 are suitable and possibly correlated Brownian motions. Recall that V_t is a Cox-Ingersoll-Ross (hereafter CIR) process whereas r_t is a generalized Ornstein Uhlenbeck (hereafter OU) process.

2 Code Implementation

```
